2019 Annual Drinking Water Quality Report

The U.S. Environmental Protection Agency (EPA) wants you to know:

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water that must provide the same protection for public health. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk.

More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791). The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and radioactive material, and it can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife. Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming. Pesticides and herbicides, which may come from a variety of sources such as agriculture, storm water runoff, and residential uses. Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems. Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

Important Information About Lead:

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Utilities Board of the City of Oneonta is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Notes:

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. Environmental Protection Agency (EPA)/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Based on a study conducted by The Alabama Department of Environmental Management (ADEM) with the approval of the EPA, a statewide waiver for the monitoring of asbestos and dioxin was issued. Thus, monitoring for these contaminants was not required.

Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of water quality. High turbidity can hinder the effectiveness of disinfectants.

Definitions

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level Goal or MRDLG: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Maximum Residual Disinfectant Level or MRDL: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Action Level (or AL): The concentration of a contaminant that triggers treatment or other requirement, a water system shall follow.

Treatment Technique (or TT): A required process intended to reduce the level of a contaminant in drinking water.

Nephelometric Turbidity Units (NTU): A measure of clarity.

Variances and Exemptions: ADEM or EPA permission not to meet an MCL or a treatment technique under certain conditions.

Non-Detect (ND): Not detectable at testing limits.

Parts per Million (PPM): milligrams per liter (mg/l). One part per million corresponds to a single penny in \$10,000.

Parts per Billion (PPB): micrograms per liter (ug/l). One part per billion corresponds to a single penny in \$10,000,000.

Parts per Trillion (PPT): nanograms per liter (nanograms/l). One part per trillion corresponds to a single penny in \$10,000,000,000.

Picocuries per Liter (pCi/L): A measure of radioactivity.

Millirems per Year (mrem/yr): Measure of radiation absorbed by the body.

Standard Units (S.U.): pH of water measures the water's balances of acids and bases. Water with less than 6.5 could be acidic, soft, and corrosive. A pH greater than 8.5 could indicate that the water is hard.

N/A: Not applicable

FDA: Food and Drug Administration.

CDC: Centers for Disease Control.

EPA: Environmental Protection Agency.

ADEM: Alabama Department of Environmental Management.

The state allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though accurate, are more than one year old. This report contains results from the most recent monitoring which was performed in accordance with the regulatory schedule.

Contaminants Monitored	Date Monitored
Inorganic Compounds	2019
Lead and Copper	2019
Microbiological Contaminants	Current

Nitrates			2019		
Radioactive Contaminants			2017		
Synthetic Organic Contaminants (including herbicides and pesticides)			2018		
Volatile Organic Contaminants			2019		
Disinfection By-products (TTHM and HAA5)			2019		
Table of Primary Drinking Water Contaminants					
CONTAMINANT			CONTAMINANT

Bromodichloromethane	ND	ND	P-Chlorotoluene	ND	ND
Bromoform	ND	ND	P-Isopropyltoluene	ND	ND
Bromomethane	ND	ND	Propachlor	ND	ND
Butachlor	ND	ND	Sec - Butylbenzene	ND	ND
Carbaryl	ND	ND	Tert - Butylbenzene	ND	ND
Chloroethane	ND	ND	Trichlorfluoromethane	ND	ND

Table of Secondary Drinking Water Contaminants

Parameters	MCLG	MCL	Low Result			High Result	Parameters (mg/L)	MCLG	MCL	Low Result
pH	7	Monitored	6.56			7.98	Aluminum	0	0.2	ND
Color, APHA (units)	N/A	15	ND			ND	Copper	N/A	1	ND
Odor	N/A	3	ND			ND	Iron	0	0.3	ND
Foaming Agents	N/A	0.5	ND			ND	Manganese	0	0.05	ND
TDS	0	500	122			122	Silver	0	0.1	ND
Fluoride	N/A	2.0	ND			ND	Zinc	0	5	ND
Sulfate	0	250	41.3			41.3	Total Hardness	0	Monitored	57
Chloride	N/A	250	13.2			13.2	Corrosivity	N/A	N/A	Non-Corrosive

Table of Detected Primary Drinking Water Contaminants

CONTAMINANT	MCLG	MCL	Range Detected			Likely Source of Contamination and Health Affects
Turbidity	N/A	TT	0.02	-	1.63	Soil Runoff.
Barium	2	2 ppm	0.016	-	0.016	Discharge of drilling wastes; discharge of metal refineries; erosion of natural deposits.
Nitrate	10	10 ppm	0.45	-	1.43	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits

Copper	1.3	AL= 1.3 ppm	ND	-	0.43	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives (90 th Percentile Value)
HAA5	N/A	60 ppb	ND	-	11	By-product of drinking water chlorination
TTHM	N/A	80 ppb	ND	-	32.9	By-product of drinking water chlorination
TOC	N/A	TT	0.2	-	1.3	Runoff from industrial, urban, and natural soils; Decomposition of plant material in surface water
Chlorine	MRDLG=4	MRDL =4 ppm	1.10	-	2.2	Drinking water additive for bacterial disinfection

Water Systems are selected by The Environmental Protection Agency (EPA) to participate in the Unregulated Contaminant Monitoring (UCMR) program to collect nationally representative data for contaminants suspected to be present in drinking water. These contaminants do not have regulatory standards. The monitoring period is between 2018 – 2020. This monitoring is used by the EPA to understand the frequency and level of occurrence of unregulated contaminants in the nation's public water systems. Every five years the EPA develops a new list of UCMR contaminants, largely based on the Contaminant Candidate List (CCL). The detection of a UCMR contaminant does not represent cause for concern, in and of itself.

Table of UCMR 4 Contaminants						
Contaminant	Minimum Reporting Level (MRL/ug/L)		Reference Concentration (ug/L)		Range Detected	
Manganese	0.4		300		ND	- 7.2
Bromochloroacetic Acid	NA		NA		ND	- 2.7
Bromodichloroacetic Acid	NA		NA		ND	- 2.4
Chlorodibromoacetic Acid	NA		NA		ND	- 0.72
Dichloroacetic Acid	NA		NA		ND	- 9.5
Monobromoacetic Acid	NA		NA		ND	- 0.34
Dibromoacetic Acid	NA		NA		ND	- 0.39
Trichloroacetic Acid	NA		NA		ND	- 6.3

UCMR Definitions:

UCMR Minimum Reporting Level (MRL): The minimum concentration that may be reported by a laboratory as a quantified value for a method analyte following analysis. The MRLs were established based on the capability of the analytical method, not based on a level established as "significant" or "harmful".

UCMR Reference Concentration: The reference concentrations are based on publicly-available health information found in the following EPA resources: 2018 Edition of the Drinking Water Standards and Health Advisories Tables [i.e., Health advisories (HA)] and the CCL 4 Contaminant Information Sheets [i.e., Health Reference Levels (HRLs)]. The primary sources of the health information used to derive the guideline values in the resources referenced above are peer-reviewed assessments from EPA or other governmental agencies. The reference concentrations are subject to change as new health assessments are completed. Reference Concentrations are not legally enforceable federal standards.

Health Reference Levels (HRL): The CCL process derives HRLs for screening purposes using available data and can be used in the Regulatory Determination process as risk-derived concentrations against which to evaluate the occurrence data to determine if contaminants may occur at levels of public health concern. HRLs are not final determinations about the level of a contaminant in drinking water that is necessary to protect any particular population and, in some cases, are derived prior to development of a complete exposure assessment using the best available data. HRLs are not legally enforceable federal standards

Health Advisories (HA): Has provide information on contaminants that can cause human health effects and are known or anticipated to occur in drinking water. EPA's health advisories are non-enforceable and non-regulatory and provide technical information to State agencies and other public health officials on health effects, analytical methodologies, and treatment technologies to assist with risk management decisions.

2019 Annual Drinking Water Quality Report

What's the Quality of My Water?

The Utilities Board of the City of Oneonta has been providing clean water to your community since 1917, helping to keep you and your family healthy. We take this mission very seriously. Our constant goal is to provide you with a safe and dependable supply of drinking water. This report covers January 1 through December 31, 2019.

Our water sources are groundwater pumped from the Fort Payne Chert Aquifer and surface water from the Calvert Prong of the Warrior River. We treat your water by the use of disinfection and filtration to remove or reduce harmful contaminants that may come from the source water.

The Utilities Board of the City of Oneonta works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future. Please feel free to visit us during our working hours or call if you have questions regarding the contents of this report.

If you have any questions about this report or concerning your water quality, please contact Jerry Smith or Rodney McCain at 205-274-7650. We want our valued customers to be informed about their water quality. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the second Monday of each month at 5:00 PM at the office of The Utilities Board of the City of Oneonta. Our offices are located at 105 High School Street, Oneonta, AL. Please visit us on our website at www.oneontautilities.com.

The Utilities Board of the City of Oneonta: Staff:

George Reid, Chairman Rodney McCain, General Manager

Chris Harvey, Vice-Chairman Jerry Smith, Superintendent

Delynn Gibbs, Secretary/Treasurer

Allen Stoffregen, Director

Mark Gargus, Director

The Utilities Board of the City of Oneonta has completed a Source Water Assessment Plan (SWAP). The SWAP is designed to tell us certain information about our source water so that we as a water supplier and you as a water consumer can better preserve and protect our source water. For more information on the SWAP, please contact Jerry Smith or Rodney McCain at 205-274-7650.
